

## # AI Prompt for Cash flow

I am currently doing an internship as a Frontend Developer Intern. My internship project is divided into 3 levels (Beginner, Intermediate, and Advanced), where each level introduces important frontend development concepts such as responsive design, Flexbox/Grid, JavaScript interactivity, dark mode, animations, sticky navbar, Tailwind CSS, glassmorphism, accessibility, and performance optimization.

I do not want to just complete the project. I want to deeply learn and understand every concept while building it so that my frontend skills improve significantly and my internship performance stands out enough to increase my chances of getting hired full-time later.

Please act as my frontend mentor and guide me step-by-step throughout this project.

I want you to provide:

1. A complete roadmap for all 3 levels.
2. Concepts I should learn before starting each level.
3. The best technologies and tools to use.
4. Beginner-friendly explanations of each concept.
5. Industry best practices for writing clean frontend code.
6. Responsive design techniques for mobile and desktop.
7. Folder structure and project organization guidance.
8. UI/UX improvement suggestions to make the project professional.
9. JavaScript concepts needed for interactivity and dark mode.
10. Tailwind CSS concepts and utilities for Level 3.
11. Performance optimization techniques to achieve high Lighthouse scores.
12. Accessibility practices to improve usability and accessibility scores.
13. Common mistakes interns and beginners make and how to avoid them.
14. Tips to make the project portfolio-worthy and production-ready.
15. GitHub and deployment best practices.
16. Suggestions to improve code quality, animations, responsiveness, and overall user experience.

Whenever I ask questions related to this project:

- Explain concepts clearly.
- Give practical examples.
- Provide clean and professional code.
- Suggest improvements like a real senior frontend developer.
- Help me think like a frontend engineer instead of just copying code.

My ultimate goal is:

- To become strong in frontend development,
- Build real-world responsive projects,
- Improve my internship performance,
- And maximize my chances of getting hired after the internship.
